```
antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUTI980-AAUT2481 represent melanoma antigen peptides of the invention

                                                      comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase trelated protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYSSO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, MYE801, MART antigens, GMY, antigens, GMY, antigens portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase ARGE; NYES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MdE antigens, BAGE antigens, MRESO1, MART antigens, GMZ, antigens of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYEsO1, MART antigen is covalently bound and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat for the treatment of melanoma antigen bound to the melanoma antigen bound to the invention is useful for inducing an immune response for the treatment of melanoma AMU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                               Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GM2, antigen fortions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYESE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                            The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigen for the antigen and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUTIS80-AAUTI281 represent melanoma antigen peptides of the invention

                                          The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, tyrosinase related protein 1, tyrosinase antigens, 6MZ, antigens, 6MZ, antigens antigens of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AdVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A new antigenic complex comprising epitopes non-covalently joined to a
heat shock protein by a molecular tether designated a javelin are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatability complex; MHC; therapy; immune response;

antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention

                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                  number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The artigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is human gpl00 MHC class I mutant peptide antigen
                                                                              comprising a

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 melanoma comprises a heat shock

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, OMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the the antigen should to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYE01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AMJ71980-AAM72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anti cancer vaccine for the treatment of melanoma comprises a heat shock
immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                     melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase ABGE; NTSB01; GM2; tyrosinase related protein 1; tyrosinase related protein 1; tyrosinase are according; avaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of induction of an immune response.

                                                                                                                                                                                                                                                                                                     ö
                                                                                                                         The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase, related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                       Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GMZ, antigence portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. ANUT1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase tyrosinase traisted protein 1, tyrosinase related protein 2, 99 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Melanoma antigen, MART-1; MAGE-1, gp100, cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; NYBS01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                             The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of induction of an immune response,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAV71980-AAV72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, BAGE antigens, NYESO1, MART antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAUT1980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti cancer vaccine for the treatment of melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                     comportaing administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GMZ, antigenic portions and combinations of these. The melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AMVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                              comprises a heat shock

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigens operations and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AUV11980-AAUV12481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Melanoma antigen, MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase BAGE; WYSE01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javobin molecule; melanoma antigen recognised by T cells-1; human.
Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunothezapeutic; heat shock protein; tyrosinase; BAGE; VRSB01; GWZ; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T cells-1; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of induction of an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gape

The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, trainingent related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                               Anti cancer vaccine for the treatment of melanoma comprises a heat shock protein and a melanoma antigen i.e. tyrosinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti cancer vaccine for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; WYSB01; GMZ; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; davelin molecule; melanoma antigen recognised by T cells-1; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AMVI1980-AAVI2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                  melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Melanoma antigen; MART-1; MAGE-1; gp100; cytostatic; immune response; immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYES01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; davelin melecule; melanoma antigen recognised by T cells-1; human.

                                                                          comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANUT1980-AAUT2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprises a heat shock

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AMU11980-AMU72481 represent melanoma antigen peptides of the invention
antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention

The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cancer vaccine for the treatment of melanoma comprises a heat shock

The melanoma antigen is covalently bound to a javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma AAU71980-AAU72481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    melanoma comprises a heat shock

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comportaing administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen a heat shock protein, and a melanoma antigen, where the melanoma antigen related protein 1, tyrosinase, tyrosinase related protein 1, tyrosinase, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, NYESO1, MART antigens, GM2, antigent portions and combinations of these. The melanoma antigen is covalently bound to a javalin molecule, where the melanoma antigen bound to the javalin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                                                                                                                                                                                                                                    Anti cancer vaccine for the treatment of melanoma comprises a heat shock
             Melanoma antigen, MART-1; MAGE-1; gp100; cytostatic; immune response; immuncherapetic; heat shock protein; tyrosinase; BAGE; NYBS01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; Javelin molecule; melanoma antigen recognised by T celle-1; human.

```

```
The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, tyrosinase related protein 1, tyrosinase antigens (MZ, antigens, MZ, antigens, MZ, antigens of these: The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AMJ1980-AMJ12481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      melanoma comprises a heat shock

comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 1, tyrosinase antigens, GM2, antigens, CM2, antigens, DA2, antigens, DA2, antigens, DA2, antigens and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma shock protein. The composition is useful for inducing an immune response for the treatment of melanoma ANV1980-AANV2481 represent melanoma antigen peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanome antigen, where the melanome antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase
  comprises a heat shock

                                                                                                                                                                                                                                                                                                    comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYESO1, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma
                                                                                                                                                                                  for the treatment of melanoma comprises a heat shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunotherapeutic; heat shock protein; tyrosinase; BAGE; NYEs01; GM2; tyrosinase related protein 1; tyrosinase related protein 2; vaccine; javelin molecule; melanoma antigen recognised by T cells-1; human.

The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatability complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken MHC class II peptide antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.

The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                                                                                                       Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatibility complex; MHC; therapy; immune response; malignancy; chicken.

The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.

The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiological conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.

The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain
                                                                                                                                                                                                                                                                                                                                                                                                              A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antigenic complex; epitope; heat shock protein; HSP; tether; javelin; major histocompatibility complex; MHC; therapy; immune response; malignancy; chicken.

The present invention relates to an antigenic complex, comprising a number of epitopes non-covalently joined to a heat shock protein (HSP) by a tethering molecule referred to as javelin which has affinity for the HSP under physiclogical conditions, where the epitopes are covalently joined to the tethering molecule and one epitope is major histocompatibility complex class I (MHC) and the other MHC class II. The antigenic complex is used to induce immune responses directed towards the treatment or prevention of infectious diseases and malignancies. The present sequence is chicken ovalbumin derived protein domain
                                                                                                                                                                                                                                                                                                                                                                                                    A new antigenic complex comprising epitopes non-covalently joined to a heat shock protein by a molecular tether designated a javelin are useful to treat or prevent infectious disease or malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Piloning, characterization and tissue distribution of the rat ATP-
binding cassette (ABC) transporter ABC2/ABCA2.";
Biochem. J. 350:865-872 (2000).
-!- FUNCTION: Probable transporter, its natural substrate has not been
found yet. May have a role in macrophage lipid metabolism and
neural development.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
